                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence encodes a piscine, Oreochromis aureus, vitellogenin secretory sequence (Vtgss). This and variants that comprise conservative replacements that retain the biological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lipopolysaccharide-binding protein coding sequence. The isolated nucleic acid is useful for assaying for heterologous gene expression, detecting the presence of a compound that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric
                                                                                                                                                                                                                                                                                 ;
                              detecting presence of compound that binds to estrogen receptor or
producing desired protein from host cell comprises nucleotide sequence

                                                                                                                                                                                                                                                                                     vitellogenin secretory sequence (Vegss), designated pBSVtgCAT was constructed. A28499 and A28722 comprise the 5'- and 3'-ends of the construct insert. Vtgss and variants that comprise conservative replacements that retain the biological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal are new Town encoding the Vtgss can be fused to either a reporter protein or a lipopolysaccharide-binding protein coding sequence. The isolated nucleic acid is useful for assaying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for heterologous game expression, detecting the presence of a compound that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining
                                                                             Isolated nucleic acid for assaying for heterologous gene expression, detecting presence of compound that binds to estrogen receptor or producing desired protein from host cell comprises nucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         systemic circulation of a desired protein in a transgenic or chimeric

vitellogenin secretory sequence (Vtgss), designated psp-VtgCAT was construct insert. Vtgss and variants that comprise conservative replacements that comprise conservative replacements that retain the biological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lipopolysaccharide-binding protein coding sequence. The isolated nucleic acid is useful for assaying for heterologous gene expression, detecting the presence of a compound that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric
                                                                                                                                                                                                                                                                                                                     Isolated nucleic acid for assaying for heterologous gene expression, detecting presence of compound that binds to estrogen receptor or producing desired protein from host cell comprises nucleotide sequence encoding secretory signal sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vtgss; vitellogenin; secretory signal sequence; gene expression; oestrogen receptor binding protein; systemic circulation; EGFP; ss.

```
vitellogenin secretory sequence (Vtgss), designated pvtgEGFP was constructed. Vtgss and variants that comprise conservative replacements that retain the biological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lipopolysaccharide-binding protein coding sequence. The isolated nucleic acid is useful for assaying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for heterologous gene expression, detecting the presence of a compound that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                   detecting presence of compound that binds to estrogen receptor or producing desired protein from host cell comprises nucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The piscine, Oreochromis aureus, vitellogenin secretory sequence (Vtgss) was fused upstream to the EcoRI-SalI cDNA fragment encoding the lippopolysaccharide-binding domain of Carcinoscorpius rotundicauda Factor C CrECES for expression and secretion of recombinant ES protein from Drosophila cells. Vtgss and variants that comprise conservative replacements that retain the biological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lipopolysaccharide-binding protein coding sequence. The isolated nucleic acid is useful for assaying for heterologous gene expression, detecting the presence of a compound that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /*tag= b

Oreochromis aureus.
 Synthetic.

Chimeric Chimeric

Vtgss-beta-lactamase fusion protein (partial) coding sequence.

(first entry)

A28507 standard; DNA; 204

```
vitellogenin secretory sequence (Vtgss), designated problection constructed. Vtgss and variants that comprise conservative constructed. Vtgss and variants that comprise conservative replacements that retain the biological activities of directing secretion of a fusion protein from a call and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lippopolysaccharide-binding protein coding sequence. The isolated nucleic acid is useful for assaying for heterologous gene expression, detecting the presence of a compound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated nucleic acid for assaying for heterologous gene expression, detecting presence of compound that binds to estrogen receptor or producing desired protein from host cell comprises nucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A reporter beta-lactamase system that uses the Oreochromis aureus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      secretory signal sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 6; Fig 14A; 73pp; English.

amino acid sequence at least 95 % identical to a polypeptide sequence of sequence at least 95 % identical to a polypeptide sequence of sequence at least 95 % identical to a polypeptide sequences of included in American Type Culture Collection (ArcC) deposit number to 203917, defined in the specification. The products of the invention have cytostatic, antiarthritic, antiasthmatic, immunosuppressive, noctropic; antiarterlosclerotic, antiasthmaticy, neuroprotective, antidiabetic, tranquiliser, vulnerary, antibacterial, antipsoriatic, antiarrhythmic, antistheumatic, cardiant and anti-HIV activity. (I) or a nucleic acid (II) encoding (I) is useful for preventing, treating or amedicating a medical condition and for diagnosing a pathological condition or susceptibility to the condition. (I) is useful for identifying a binding partner which affects the activity of the polypeptide and for identifying an activity in a biological sample. (I), (II) or an antibody (IV) specific to (I) is also useful for treating or preventing a disease, disorder or condition

include immune disorders such as autcimmune diseases, blood protein disorders, anemia, allergic reactions and conditions such as asthma, organ rejection or graft-versus-host disease, inflammation, hyper proliferative disorders, cardiovascular disorders such as asthma, organ rejection or graft-versus-host disease, inflammation, hyper proliferative disorders, cardiovascular disorders such as arterioarterial fistula, arrhythmias, arteriosclerosis, coronary thrombosis, organ regeneration, cancer, neovascular glaucoma, diabetic retinopathy, rheumatoid arthritis, psoriasis, diseases associated with increased apoptosis that include acquired immunodeficiency syndrome (AIDS), neurological diseases such as Parkinson's disease, viral, bacterial, fungal or parasitic diseases. They are also used to repair, replace or protect tissue damage by congenital defects, to treat trauma, in surgery, including cosmetic plastic surgery, to treat fibrosis, reperfusion injury or systemic cytokine damage, to stimulate chondrocyte growth, to prevent skin aging due to sunburn, to change a mammal's mental state or physical state by influencing biorhythms, cardiac rhythms, depression, memory, or antagonist are useful as food additives or preservatives to increase associated with aberrant expression of (I). Diseases treated or diagnosed or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamin, mineral or other nutritional components. (I) is useful in for screening therapeutic compounds. (II) is useful in forensic biology for detecting DNA sequences and as diagnostic probes for detecting the presence of specific mRNA in a particular cell type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human beta-lactoglobulin 5' fragment used to construct hybrid genes
                                                                                                                                                                                                                                                                                  propertide, operably linked to DNA encoding two-chain cleavage state-modified protein C (see W25085-86), the 2 DNA sequences being linked to elements required for protein C expression in a mammary gland of a host female animal, such as beta-lactoglobulin gene promoter; and (b) using the DNA construct to breed a transgenic animal (esp. sheep, rabbit, cattle, goat) that produces protein C in its milk, at least 90% of the protein C being in the two-chain
                                                                                                            This DNA sequence comprises the ovine beta-lactoglobulin gene including the promoter region. A DNA segment encompassing the 5' flanking promoter region can be utilised in novel constructs for the expression of human protein C in the milk of a transgenic animal. A claimed method involves: (a) providing a DNA construct comprising DNA encoding a secretion signal and a protein C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 10807;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 10807 BP; 2214 A; 3066 C; 2985 G; 2542 T; 0 other;

                                                                                                                                                                                                                                                        ö
                                                                                                                              The present sequence represents a fragment of beta-lactoglobulin (BLG) used in the construction of hybrid genes. The hybrid construct comprises BLG 5'-flanking sequences and BLG intragents sequences in conjunction with a desired cDNA or minigene or gene for targetting expression of the encoding DNA. The construct is used for producing transgenic mammals that secret human serum albumin (HSA) in their milk. By using BLG, the

The invention provides a transgenic bovine in which the somatic and germ cells contain a transgene comprising a regulatory sequence from a gene expressed in mammary glands. DNA encoding a signal sequence and DNA encoding a naturally occurring heterologous polypeptide. The transgenic bovine, or its descendants, produce milk containing the heterologous polypeptide. The transgenic bovines are used to express human milk and serum proteins or industrial enzymes, specifically for infant formulations that contain human lactoferrin for control of intestinal cortact infections and to improve iron absorption, particularly when potentiated by human lysozyme. The polypeptide expressed may also be human albumin, used as a plasma extender. The polypeptide expressed in milk of the transgenic bovine requires little if any purification before human consumption and is expressed at significantly higher levels than in transgenic mice or sheep. Large polypeptides that are difficult to express in other systems can also be expressed. The present sequence
controlled by mammary-specific
the milk, particularly human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Heyneker HL, Platenburg G, Pieper F, Krimpenfort PJA;

```
New transgenic bovine whose mammary gland cells contain DNA encoding a signal sequence, and a polypeptide of interest and an expression regulatory sequence, for producing polypeptides in bovine milk
                                                                                                                                                                       invention relates to a transgenic or chimeric bovine whose
                                                                                                                                                                                        mammary gland cells contain a construct encoding a signal sequence, a polypeptide of interest and a regulatory sequence that promotes expression of the DNA sequence. The transgenic or chimeric bovine is useful for producing recombinant polypeptides in milk of female transgenic mammals. The recombinant polypeptide may be used in food formulations, particularly in infant formula having either nutritional or beneficial value. An infant formula containing human lactoferrin from the transgenic bovine milk provides bacteriostatic
                                                                                                                                                                                                                                                                                                                                                                                                                         effect, which aids in controlling diarrhoea in newborn. Recombinant polypeptides may also be used to supplement common diet formulations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 824 BP; 138 A; 278 C; 245 G; 163 T; 0 other;

WPI; 2000-587513/55 P-PSDB; B56832. Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as prostate cancer -

```
re1556 to F16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in B56363 to B57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardiactive, immunoomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders purposes. The prostate cancer antigens may be used to treat disorders purposes in equal, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. F16506 to F16514 to B57303 represent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                        used in the exemplification of the present invention.

which encodes 2-2-83 protein. The expression of this gene is modulated by hypoxic conditions. 2-2-83 protein has anti-hypoxic, vasotropic, neuroprotective, antiapoptotic, anglogenic and tumourigenic activity. It can be used for diagnosing and treating hypoxia and ischaemia and regulating apoptosis, anglogenesis, neurite outgrowth and tumourigenesis. 2-2-83 nucleotide sequence may be used in gene therapy and is a useful source of diagnostic probes to identify hypoxia

WPI; 2000-341710/30 P-PSDB; Y92730. Novel isolated Seladin-1 polypeptide useful in the diagnosis, prognosis and treatment of neurological diseases, e.g. Alzheimer's disease and Amyotrophic lateralsclerosis

Claim 1; Fig 14; 47pp; English.

The present cDNA encodes seladin-1. The cDNA was isolated by differential display PCR using total RNA from post-mortem brain tissues from Alzheimer's disease patients and control subjects. The seladin-1 cDNA or protein reduces or prevents the degeneration of neurons and slows brain amyloid formation. They may be used to diagnose or prognose a neurological disease or to evaluate a treatment for a neurological disease claimed). Neurological diseases treatable by seladin 1 cDNA or protein include Alzheimer's disease, Parkinson's disease, Huntingdon's disease, Amyotrophic lateralsclerosis and Pick's disease.

Unpublished observations (FEB-2000).

-!- CATALYTIC ACTIVITY: ATP + H(2)0 = ADP + ORTHOPHOSPHATE.

-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

-!- SUBLEALLY: BELONGS TO THE CATION TRANSPORT ATPASES FAMILY (E1-E2 ATPASES). SUBFAMILY IV.

-!- CAUTION: REF.1 SEQUENCE DIFFERS AT SEVERAL POSITIONS FROM THAT SHOWN DUE TO DIFFERENCES IN THE PREDICTION OF SPLICE SITES.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- INDUCTION: BY TGF BETA.
-!- DISEASE: DEFECTS IN TGFBI ARE THE CAUSE OF AT LEAST FIVE AUTOSOMAL DOMINANT TYPES OF CORNEAL DYSTROPHES: GRANULAR DYSTROPHY GROENOUW TYPE I (CDGI), REIS-BUECKLES CORNEAL DYSTROPHY (CDRB), LATTICE CORNEAL DYSTROPHY TYPES I AND IIIA (CDLI AND CDL3A) AND AVELLINO CORNEAL DYSTROPHY (ACD). CLINICALLY THEY SHOW PROGRESSIVE OPACIFICATION OF THE CORNEA LEADING TO SEVERE VISUAL HANDICAP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              'A kerato-epithelin (beta-ig-h3) mutation in lattice corneal dystrophy
                                                                                                                                                                                                                                                                                        Kimmerly W., Bondoc M., Cheng J., Connolly K.S., Gunning K.M.,

-I PUNCTIONE BINDS TO TYPE I, II, AND IV COLLAGENS. THIS ADHESION PROTEIN MAY PLAY AN IMPORTANT ROLE IN CELL-COLLAGEN INTERACTIONS.

IN CARTILAGE, MAY BE INVOLVED IN ENDOCHONDRAL BONE FORMATION. MAY PLAY AN IMPORTANT ROLE IN THE MORPHOGENESIS OF CORNEAL TISSUES.

-I SUBGELLULAR LOCATION: EXTRACELLULAR. MAY BE ASSOCIATED BOTH WITH MICROFIBRILS AND WITH FEE CELL SURFACE (BY SIMILARITY).

-I TISSUE SPECIFICITY: LOCATED PRIMARILY IN THE EPITHELIUM OF NORMAL ADUIT CORNEA, IN FETAL STROMAL CELLS, AND BOTH ENDOTHELIUM - AND STROMA-DERIVED CELLS IN HEALING CORREAL WOUNDS. NOT EXPRESSED IN NORMAL ADULT ENDOTHELIUM AND STROMA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Halleck M.S., Lawler J.F. - DISEAGE: DEFECTS IN FICT ARE THE CAUSE OF BENICN RECURRENT
INTRAHEPATIC CHOLESTASIS (BRIC OR SUMMERSKILL SYNDROME), AN
ADTOSOMAL RECESSIVE DISCADER, CHARACTERIZED BY INTERMITTENT
EPISODES OF CHOLESTASIS WITHOUT EXTRAHEPATIC BILE DUCT
OBSTRUCTION, WITH INTIAL LELVATION OF SERUM BILE ACIDS, FOLLOWED
BY CHOLESTATIC JAUNDICE WHICH GENERALLY SPONTANEOUSLY RESOLVES
AFTER PERIODS OF WEEKS TO MONTHS.
-!- DISEAGE: DEFECTS IN FICT COULD BE ASSOCIATED WITH RECURRENT
INTRAHEPATIC CHOLESTASIS OF PREGNANCY (ICP OR RICP PREGNANCY-
RELATED COLOLESTASIS), CHARACTERIZED BY GENERALIZED ITCHING, WITH
OR WITHOUT JAUNDICE, ABSENCE OF BILLARY COLLC, ABSENCE OF JAUNDICE
OR PRURITUS BETWEEN PREGNANCIES, AND ABSENCE OF CHRONIC LIVER
DISEAGE: APPERRS DURING PREGNANCY (PRIMARILY IN THE THIRD
TRIMESTER), AND DISAPPEARS SHORTLY POSTPARTUM. MAY BE A FEMALE-
LIMITED AUTOSOMAL DOMINANT INHERITANCE.
-!- SIMILARITY: BELONGS TO THE CATION TRANSPORT ATPASES FAMILY (E1-E2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. of olfactory receptor neurons in insects.";
J. Neurobiol. 22:74-84(1991).

-!- FUNCTION: THIS MAJOR SOLUBLIZE PROFEIN IN OLFACTORY SENSILLA OF MALE MOTHS MIGHT SERVE TO SOLUBILIZE THE EXTREMELY HYDROPHOBIC PREROMONE THROUGH THE AQUEOUS IXMPH TO RECEPTORS LOCATED ON OLFACTORY CILIA. PBP IS ALSO FOUND IN SENSILLA PROMERE (PROBABLE).
-!- SUBUNIT: HOMODIMER (PROBABLE).
-!- TISSUE SPECIFICITY: ANTENNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

This sequence is that of a piscine, Oreochromis aureus, vitellogenin secretory sequence (Vtgss). This and variants that comprise conservative replacements that retain the biological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lipopolysaccharide-binding for either a sepression, detecting the presence of a compound for heterologous gene expression, detecting the presence of a compound that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric detecting presence of compound that binds to estrogen receptor or producing desired protein from host cell comprises nucleotide sequence Isolated nucleic acid for assaying for heterologous encoding secretory signal sequence Claim 1; Page 36; 73pp; English

detecting presence of compound that binds to estrogen receptor or producing desired protein from host cell comprises nucleotide sequence encoding secretory signal sequence

Example 2; Fig 5B; 73pp;

Vitallogenia secretory sequence (Vtgss), designated psp-VtgGAT was constructed. A28499 and A28722 comprise the 5'- and 3'-ends of the construct insert. Vtgss and variants that comprise onservative replacements that retain the bloodogical activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lipopolysaccharide-binding protein coding sequence. The isolated nucleic acid is useful for assaying for heterologous gene expression, detecting the presence of a compound that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric reporter CAT system that uses the piscine, Oreochromis aureus,

                                                                                                                                                                                                                                                                                                                                         ó
                                                                                                     A reporter GFP system that uses the piscine, Oreochromis aureus, vitellogenin secretory sequence (Vtgss), designated pVtgEGFP was constructed. Vtgss and variants that comprise conservative replacements that retain the blological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lipopolysaccharide-binding protein coding sequence. The isolated nucleic acid is useful for assaying that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenc or chimeric
                    Isolated nucleic acid for assaying for heterologous gene expression, detecting presence of compound that binds to estrogen receptor or producing desired protein from host cell comprises nucleotide sequence
                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vtgss; vitellogenin; secretory signal sequence; gene expression; oestrogen receptor binding protein; systemic circulation; factor C.

The piscine, Oreochromis aureus, vitellogenin secretory sequence (Vtgss)
was fused upstream to the EcoRI-SalI cDNA fragment encoding the
lipopolysaccharide-binding domain of Carcinoscorpius rotundicauda Factor
C CrFCES for expression and secretion of recombinant ES protein from
Drosophila cells. Vtgss and variants that comprise conservative
replacements that retain the biological activities of directing secretion
of a fusion protein from a cell and claevage of the secretory signal
sequence from the fusion protein, are new. DNA encoding the Vtgss can be
fused to either a reporter protein or a lipopolysaccharide-binding
for the terologous gene expression, detecting the presence of a compound
that binds to an oestrogen receptor in a sample or producing a desired
protein from a host cell. It can also be used in a method for obtaining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        29-JUN-1999
30-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                    A reporter beta-lactamase system that uses the Oreochromis aureus, vitellogenin secretory sequence (Vtgss), designated pBADVtgblactKana was constructed. Vtgss and variants that comprise conservative replacements that retain the blological activities of directing secretion of a fusion protein from a cell and cleavage of the secretory signal sequence from the fusion protein, are new. DNA encoding the Vtgss can be fused to either a reporter protein or a lipopolysaccharide-binding protein coding sequence. The lasolated nucleic acid is useful for assaying for heterologous gene expression, detecting the presence of a compound that binds to an oestrogen receptor in a sample or producing a desired protein from a host cell. It can also be used in a method for obtaining systemic circulation of a desired protein in a transgenic or chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

with an oligo(dT) primer [ATGTGGCCTTTTTTTTTTTTTTTTT];
double-stranded cDNA was ligated to a DraIII adaptor
[TGTTGGCCTACTGG], digested and cloned into distinct DraIII
sites of the pWE18S-FL3 vector (5' site CACTGTGTG, 3' site
CACCATGTG). XhoI should be used to isolate the cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Danio rerio

/note="vector: pME18S-FL3; Site_1: Draili (CACTGTGTG);
Site_2: Draili (CACCARGTG); 1st strand cDNA was primed
with an oligo(dT) primer [ATGTGGCCTTTTTTTTTTTTTTTTTT];
double-stranded cDNA was ligated to a Draili adaptor
[FGTTGGCCTACTGG], digested and cloned into distinct Drail
sites of the pHE18S-FL3 vector (5' site CACTGTGTG, 3' site
CACCATGTG). XhoI should be used to isolate the CDNA
insert. Size selection was performed to exclude fragments
<1.5kb. Library constructed by Dr. Sumio Sugano

with an oligo(dT) primer [ATGGGCTTTTTTTTTTTTT];
double-stranded oDNA was ligated to a Draili adaptor [TGTTGGCTTTTTTTTTTTT];
double-stranded oDNA was ligated to a Draili adaptor [TGTTGGCTACTG], digested and cloned into distinct Draili sites of the pME18s-FL3 vector (5' site CACTGTGTG, 3' site CACCATGTC). Xhoi should be used to isolate the cDNA insert. Size selection was performed to exclude fragments close in Library constructed by Dr. Sumio Sugano (University of Tokyo Institute of Medical Science) and kindly donated by Dr. Kolchi Kawakami. Custom primers for sequencing: 5' end primer CTTCTGCTCTAAAAGCTGCG and 3' end primer CGACCTGCAGCAGCACA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota: Metazoa, Chordata; Craniata; Vertebrata; Euteleostomi; Actinopterygii; Neopterygii; Teleostei; Euteleostei; Ostariophysi; Cypriniformes; Cyprinidae; Rasborinae; Danio.

/note="vector: pME18S-FL3; site_1: DralII (CACTGTGTG);
Site_2: DralII (CACTGTG); lst strand cDNA was primed
with an oligo(dT) primer [ATGGGCCTTTTTTTTTTTTTTT];
double-stranded cDNA was ligated to a DralII adaptor
[TGTGGCCTACTGG], digested and cloned into distinct DralII
sites of the pME18S-FL3 vector (5' site CACTGTGTG, 3' site
CACCATGTG). XhoI should be used to isolate the cDNA
insert. Size selection was performed to exclude fragments
<1.5kb. Library constructed by Dr. Sumio Sugano
(University of Tokyo Institute of Medical Science) and
kindly donated by Dr. Koichi Kawakami. Custom primers for
sequencing: 5' end primer CTACTGCTCTAAAAGCTGCG and 3' end
primer CGACTGCAGCACA.

Site_2: Draili (CACCATGG); lst strand cDNA was primed
with an oligo(dT) phimer (ArGrGGCTTTTTTTTTTTTTTTTTTT);
double-stranded cDNA was ligated to a Draili adaptor
[TGTTGGCTACTGG], digested and cloned into distinct Draili
sites of the phEl8s FL3 vector (5' site CACTGTGG', 3' site
CACCATGTG). XhoI should be used to isolate the cDNA
insert. Size selection was performed to exclude fragments
closher Size selection was performed to exclude fragments
(University of Tokyo Institute of Medical Science) and
kindly donated by Dr. Kolchi Kawakami. Custom primers for
sequencing: 5' end primer CTTCTGTGTAAAGGTGGG and 3' end
primer CGACCTGGAGCAGAA.
